

PROJECT IDEAS

Idea I

Train machine learning models with poems of great poets from the past and then the model could generate poems of that style and we can have that literature back !

Idea II

Using CNNs in Health Care industry to detect the diseases based on images of X Rays or other scans. Like detecting tuberculosis based on images of Chest X Rays. Would be efficient and giving it a mobile interface will make it very cheap.(No travelling/Consultation fees for poor)

Idea III

A Programme to predict the success rate/ evaluation of a start up (Very difficult to make because no one knows what parameters to look for and no Data) but makes lives of startups and investors easy !
